

IBD – <u>Intergiciels</u> et Bases de Données

Servlet-based distributed systems

Fabien Gaud, fabien.gaud@inrialpes.fr

http://www-ufrima.imag.fr/ ⇒ Placard électronique ⇒ M1 Info ⇒ IBD

Overview of lectures and practical work

- Lectures
 - Introduction to distributed systems and middleware
 - Socket-based distributed systems
 - RMI-based distributed systems
 - Servlet-based distributed systems
 - Introduction to multi-tier distributed Internet services
- Practical work
 - Programming distributed systems with Sockets
 - Programming distributed systems with RMI
 - Programming distributed systems with Servlets
 - Project on multi-tier Internet services

F. Gaud / S. Bouchenak

Distributed systems & Middleware

Introduction – Web applications

3

- Communication between client and server
 - In a web application, client and server communicate via the HTTP protocol (HyperText Transfer Protocol)
- Web requests
 - Client wants to access a remote "resource" available on the server
 - A resource in the WWW is identified and located using a URL
 - A resource can be:
 - a file or a directory
 - a reference to a more complicated object, e.g. a query to a database, a query to a search engine, a program to run

F. Gaud / S. Bouchenak Distributed systems & Middleware

What are Servlets

- Servlets are Java programs which run in a server
 - Need a JVM and a servlet container
- They can be remotely requested (e.g. by web clients)
- Servlets that run on a web server build web pages on the fly, and return them to clients
- Building web pages on the fly is useful for a number of reasons:
 - The Web page is based on data submitted by the user
 - The data changes frequently
 - The Web page uses information from corporate databases or other such sources

Advantages of Servlets

- Efficiency
 - One process, the JVM
 - One thread per request (with traditional CGI, one process per request)
 - Can use pool of threads
 - Memory efficiency since servlet code is only loaded one time
- Portability
 - Servlets are written in Java and follow a well-standardized API.
 - Servlets can run virtually unchanged on any Servlet server (e.g. Apache Tomcat, IBM's WebSphere Application Server, etc.)
- Power
 - User session tracking
 - Database connection pools
 - etc.

Distributed systems & Middleware

Outline

- Introduction
- HTTP basics
- Servlet basics
- Miscellaneous

F. Gaud / S. Bouchenak

Distributed systems & Middleware

HTTP basics

- HTTP: HyperText Transfer Protocol
 - A communication protocol
 - Used to transfer hypertext data on the World Wide Web (WWW)
- A protocol (in the general sense)
 - Guidelines and rules governing interactions between two parties
 - Examples:
 - In diplomacy: standards of behavior and ceremony to be observed by diplomats and heads of state in relation to each other
 - · Tests and experiments: clinical trial protocol, the method used in a clinical trial of a drug or medical treatment
 - Computing: a set of rules governing communication between computing endpoints

F Gaud / S Bouchenak Distributed systems & Middleware

Headers

Requests

Responses

HTTP protocol specifies

HTTP basics (2)

- Reguests invoke a particular method within the set of HTTP methods
 - HTTP GET method
 - HTTP POST method
 - Other HTTP methods

Distributed systems & Middleware

F Gaud / S Bouchenak

HTTP requests

- HTTP: a simple stateless communication protocol
 - An HTTP client (e.g. a web browser) makes a request to an HTTP server
 - The HTTP server (e.g. a web server) responds
 - And the transaction is done
- Possibilities to maintain a client session
- Request
 - Client request has the following form:
 - a method,
 - target resource address (a URL),
 - HTTP protocol version

F. Gaud / S. Bouchenak

Distributed systems & Middleware

HTTP request headers

- When sending the request, the client can send optional header information containing extra information about the request such as:
 - What software the client is running
 - What content types the client understands
- The request ends with an empty line
- This information does not directly pertains to what was requested, but it could be used by the server to generate its response

F. Gaud / S. Bouchenak

Distributed systems & Middleware

HTTP Request Example

11

GET / HTTP/1.1\r\n

Host: www.google.fr\r\n

User-Agent: Mozilla/5.0 (X11; U; Linux x86_64; en-US; rv:1.9.0.3) Gecko/2008092814 Iceweasel/3.0.3 (Debian-3.0.3-3)\r\n

Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8\r\n

Accept-Language: fr-fr,fr;q=0.8,en-us;q=0.5,en;q=0.3\r\n

Keep-Alive: 300\r\n

Connection: keep-alive\r\n

\r\n

HTTP responses

12

10

- After the server processes the request, it sends an HTTP response
- The first line of the response specifies the following:
 - server's HTTP protocol version
 - a status code (e.g. 200 for successful, 404 for "Not Found")
 - a description of the status code

F. Gaud / S. Bouchenak Distributed systems & Middleware

HTTP response headers

- After sending the status line, the server sends header information
- The header tells the client extra information about the response such as:
 - What software the server is running
 - Mime type
 - Last modification
 - ...
- The server sends a blank line after the header
- If the request was successful, the requested data is sent as part of the response

F. Gaud / S. Bouchenak

Distributed systems & Middleware

13

HTTP Response example

HTTP/1.1 200 OK\r\n

Content-Type: text/javascript; charset=UTF-8\r\n Expires: Sat, 31 Oct 2009 00:00:00 GMT\r\n Last-Modified: Sat, 03 Nov 2007 00:00:00 GMT\r\n

Content-Encoding: gzip\r\n

Date: Sat, 01 Nov 2008 15:39:48 GMT\r\n Server: gws\r\n

Content-Length: 2098

\r\n

F. Gaud / S. Bouchenak

Distributed systems & Middleware

14

HTTP GET method

15

- GET method is designed for getting a resource
 - Examples:
 - an HTML/image file,
 - a chart
 - the result of a database query
- GET method can have parameters that better describe what to get
 - Example: an x, y scale for a dynamically created chart
 - Parameters are passed as a sequence of characters appended to the request URL (i.e. a query string)

http://www.google.com/search?hl=fr&q=java+servlet&

F. Gaud / S. Bouchenak

Distributed systems & Middleware

HTTP POST method

16

- POST method is designed for posting information
 - Examples:
 - a credit card number
 - some new chart data
 - information to be stored in a database
- POST method passes all its data as part of the HTTP request body
 - It may need to send megabytes of information
- POST requests should not be bookmarked or emailed (or reloaded)

F. Gaud / S. Bouchenak Distributed

Distributed systems & Middleware

Other HTTP methods

- HEAD method
 - Sent by a client when it wants to see only the headers of the response
- PUT method
 - Place documents directly on the server
- DELETE method
 - Delete documents from the server
- TRACE method
 - Return to the client the exact contents of its request (used for debugging)
- OPTIONS method
 - Ask the server which methods its supports

F. Gaud / S. Bouchenak

Distributed systems & Middleware

17

Servlet lifecycle (2)

- A Servlet is an instance of a class which implements the javax.servlet.Servlet interface
- A Servlet server initializes a Servlet by
 - loading the Servlet class, and
 - creating an instance of the Servlet by calling the no-args constructor.
 - calling the Servlet's init(ServletConfig config) method
- Servlet's init(ServletConfig config) method
 - Performs any necessary initialization of the Servlet and stores the ServletConfig object
 - The ServletConfig object contains Servlet parameters and a reference to the Servlet's ServletContext
- Is guaranteed to be called only once during the Servlet's lifecycle

Servlet lifecycle (3)

- Servlet's service method
 - When the Servlet is initialized, its service(ServletRequest req, ServletResponse res) method is called for every request to the Servlet
 - The method is called concurrently (i.e. multiple threads may call this method at the same time)
 - It should be implemented in a thread-safe manner
- Servlet's destroy method
 - Sometimes, a Servlet may need to be unloaded (e.g. because a new version should be loaded or the server is shutting down)
 - When the Servlet needs to be unloaded, the destroy() method is called
 - There may still be threads that execute the service method when destroy is called, so destroy has to be thread-safe
 - This method is guaranteed to be called only once during the Servlet's lifecycle

F Gaud / S Bouchenak

Distributed systems & Middleware

Servlet API

- Package javax.servlet
 - Contains classes to support generic, protocol-independent servlets
 - Some elements of the package:
 - Servlet interface:
 - · defines methods that all servlets must implement
 - GenericServlet abstract class:
 - defines a generic, protocol-independent servlet
 - ServletRequest interface:
 - defines an object to provide client request information to a servlet
 - ServletResponse interface:
 - · defines an object to assist a servlet in sending a response to the client
 - ServletConfig interface:
 - Information used by a servlet container to pass to a servlet during initialization
 - ServletContext interface:
 - defines a set of methods that a servlet uses to communicate with its servlet container (e.g. write to a log file, bind an object to a given attribute, ...)

F. Gaud / S. Bouchenak

Distributed systems & Middleware

25

Servlet API (2)

- Package javax.servlet.http
 - Contains classes to support HTTP-based servlets
 - Some elements of the package:
 - HttpServlet abstract class:
 - subclass of GenericServlet, provides an abstract class to be subclassed to create an HTTP servlet suitable for a Web site
 - HttpServletRequest interface:
 - extends the ServletRequest interface to provide request information for HTTP servlets
 - HttpServletResponse interface:
 - extends the ServletResponse interface to provide HTTP-specific functionality in sending a response

F. Gaud / S. Bouchenak

Distributed systems & Middleware

26

HTML basics

27

- The most basic type of HTTP servlet generates HTML pages
- HTML (HyperText Markup Language)
 - The predominant markup language for web pages
 - Provides a means to describe the structure of text-based information in a document
 - Denotes certain text as headings, paragraphs, lists, etc.
 - Supplements the text with interactive forms, embedded images, and other objects

An HTML source page

28

F. Gaud / S. Bouchenak

Distributed systems & Middleware

F. Gaud / S. Bouchenak

Distributed systems & Middleware

A simple HTTP Servlet

```
import java.io.*;
import javax.servlet.*;
import javax.servlet.http.*;

public class HelloWorldServlet extends HttpServlet {

   public void doGet(HttpServletRequest req, HttpServletResponse res)
        throws ServletException, IOException {

        res.setContentType("text/html");
        PrintWriter out = res.getWriter();
        out.println("HTML>");
        out.println("HEAD> <TITLE> Hello World </TITLE> </HEAD>");
        out.println("GBODY> <P> Hello World </P> </BODY>");
        out.println("
        out.println("
}
```

Distributed systems & Middleware

Getting information from requests

- A request contains data passed between a client and the servlet
- All requests implement the ServletRequest interface
- This interface defines methods for accessing information such as:
 - String getParameter(String name):
 - returns the value of a request parameter as a String
 - String getProtocol():
 - returns the name and version of the protocol the request uses
 - String getRemoteAddr():
 - returns the Internet Protocol (IP) address of the client that sent the request
 - etc.

F. Gaud / S. Bouchenak

Distributed systems & Middleware

30

Getting information from requests (2)

31

Example:

F. Gaud / S. Bouchenak

F. Gaud / S. Bouchenak

- A customer wishes to get information about a book.
- He calls BookInfoServlet and includes the identifier of the book in his request
- For example: http://host:port/servlets/BookInfoServlet?bookId=1234

Distributed systems & Middleware

The HTML source form

Distributed systems & Middleware

33

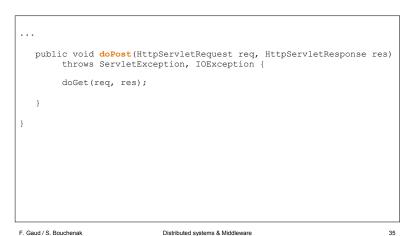

Basic HTTP Servlet structure

F. Gaud / S. Bouchenak

Distributed systems & Middleware

34

Basic HTTP Servlet structure (2)

Outline

- Introduction
- HTTP basics
- Servlet basics
- Miscellaneous
 - User authentication
 - User session based on username
 - User session based on cookies

F. Gaud / S. Bouchenak

Distributed systems & Middleware

User authentication

- Objective
 - Restrict access to some of resources of the web application
- Example
 - A magazine is published online
 - Only paid subscribers can read the articles
- Principles
 - An HTTP server has a built-in capability to restrict access to some or all of its resources to a given set of registered users.
 - How to set up restricted access depends on the server, but here are the underlying principles
 - The first time a web client (e.g. Browser) attempts to access one of these resources, the HTTP server replies that it needs special user authentication

F. Gaud / S. Bouchenak

Distributed systems & Middleware

37

User authentication (2)

- Principles (cont.)
 - When the browser receives this response, it usually asks the user for a name and password

- Once the user enters his information, the browser again attempts to access the resource, this time attaching the user's name and password along with the request
- If the server accepts the name/password pair, it happily handles the request.
- If, on the other hand, the server doesn't accept the name/password pair, the browser is denied

F. Gaud / S. Bouchenak

Distributed systems & Middleware

38

Servlets and user authentication

39

- When access to a servlet has been restricted by the server, the servlet can get the name of the user that was accepted by the server
 - Uses the getRemoteUser() method
 - This information is retrieved from the servlet's HttpServletRequest object
 - public String HttpServletRequest.getRemoteUser()
- This method returns the name of the user making the request as a String, or null if th user login is not known
 - At this time, the user authentication has already been done by the server

User session based on username

40

- Username can be used to track a client session.
- Once a user has logged in, the browser remembers his username
- A servlet can identify the user through his username and thereby track her session
- Example
 - if the user adds an item to her virtual shopping cart, that fact can be remembered (e.g. in a shared class or external database)
 - This can be used later by another servlet when the user goes to the check-out page

F. Gaud / S. Bouchenak Distributed systems & Middleware

User session based on username (2)

- Example:
 - A servlet utilizes user authorization to add items to a user's shopping cart

```
String name = req.getRemoteUser();
if (name == null) {
    // Explain that the server administrator should
    // protect this resource
} else {
    String[] items = req.getParameterValues("item");
    if (items != null) {
        for (int i = 0; i < items.length; i++) {
            addItemToCart(name, items[i]);
        }
    }
}</pre>
```

F. Gaud / S. Bouchenak

Distributed systems & Middleware

41

User session based on username (3)

- Example:
 - Another servlet can then retrieve the items from a user's cart

```
String name = req.getRemoteUser();
if (name == null) {
    // Explain that the server administrator should protect
    // this page
} else {
    String[] items = getItemsFromCart(name);
    ...
}
```

F. Gaud / S. Bouchenak

Distributed systems & Middleware

User session based on cookies

- Servlet API provides the javax.servlet.http.Cookie class for working with cookies
- A cookie is created with the Cookie() constructor
 - public Cookie(String name, String value)
 - Value can be changed later
- A servlet can send a cookie to the client by passing a Cookie object to the addCookie() method of HttpServletResponse
 - public void HttpServletResponse.addCookie(Cookie cookie)
- Because cookies are sent using HTTP headers, they should be added to the response before you send any content.
- Number and size of cookie are restricted

F. Gaud / S. Bouchenak Distributed systems & Middleware

43

User session based on cookies (2)

A servlet sets a cookie like this:

```
Cookie cookie = new Cookie("ID", "123");
res.addCookie(cookie);
```

 A servlet retrieves cookies by calling the getCookies() method of HttpServletRequest:

public Cookie[] HttpServletRequest.getCookies()

A servlet fetches cookies looks like this:

```
Cookie[] cookies = req.getCookies();

if (cookies != null) {

for (int i = 0; i < cookies.length; i++) {

String name = cookies[i].getName();

String value = cookies[i].getValue();

}

F. Gaud / S. Bouchenak
